Replacement therapy in congenital or acquired conditions associated with a deficiency or absence of endogenous testosterone, such as: Primary hypogonadism (congenital or acquired): Testicular failure caused by cryptorchidism, bilateral torsion, orchitis, vanishing testis syndrome, orchiectomy, Klinefelter syndrome, chemotherapy, or toxic damage from alcohol or heavy metals. These men usually have low serum testosterone levels and gonadotropins (follicle-stimulating hormone [FSH], LH) above the normal range. Secondary hypogonadism (congenital or acquired): Idiopathic gonadotropin or luteinizing hormone (LH)releasing hormone (LHRH) deficiency or pituitary-hypothalamic injury from tumors, trauma, or radiation. These men have low serum testosterone concentrations but have gonadotropins in the normal or low range. The U.S. Food and Drug Administration (FDA) cautions that prescription testosterone products are approved only for men who have low testosterone levels caused by certain medical conditions. The benefit and safety of these medications have not been established for the treatment of low testosterone levels due to aging, even if a man's symptoms seem related to low testosterone. We are requiring that the manufacturers of all approved prescription testosterone products change their labeling to clarify the approved uses of these medications. We are also requiring these manufacturers to add information to the labeling about a possible increased risk of heart attacks and strokes in patients taking testosterone. Health care professionals should prescribe testosterone therapy only for men with low testosterone levels caused by certain medical conditions and confirmed by laboratory tests. [FDA Drug Safety Communication (03-03-2015)]

Exclusion Criteria
Use in women Men with carcinoma of the breast or known or suspected carcinoma of the prostate Low testosterone due to aging (per FDA, this is not included in the indication of idiopathic hypogonadism)

Patients with palpable prostate nodule or induration or PSA more than 4 ng/mL or PSA more than 3 ng/mL in men at high risk of prostate cancer require urological evaluation prior to approval, and/or b. Men older than 40 years with baseline PSA more than 0.6 ng/mL will require prostate exam and PSA measurement prior to treatment approval AND 6) Assessment of patients past medical history (i.e. breast or prostate cancer, age, cardiovascular disease, liver disease, diabetes, age, obesity, obstructive sleep apnea, BPH) and documented discussion about the risks and benefits of testosterone therapy

Age Restriction
18 years or older

Prescriber Restriction

Initial: 6 months, Reauthorization: 1 year

Studies have suggested an increased risk of cardiovascular events among groups of men prescribed testosterone therapy. The Endocrine Society suggests it may be prudent to avoid testosterone therapy in men who have experienced a cardiovascular event (e.g., myocardial infarction [MI], stroke, acute coronary syndrome) in the past 6 months. These risks are currently under review by the FDA. The Endocrine Society recommends against starting testosterone therapy in patients with untreated severe obstructive sleep apnea, severe untreated BPH with International Prostate Symptom Score of more than 19, or uncontrolled or poorly controlled heart failure.
